Photoshop CS5 is the current version of Photoshop. It comes with a host of new features, including:

- Blur Layers, which allow you to create a new layer and blur a single object or image with a large brush or the Blur tool.
- The ability to select the Modeling Profiles of any object — even your own face!
- The addition of innovative features to the Select tool, including using the magic wand or making a marquee selection in any area.
- Refine Edge, a new tool that enables you to easily sharpen an area of an image while leaving the rest of the image untouched, making it possible to use a less-than-perfect shot for the final image. You can apply a specific amount of sharpening to either the edges or the whole of an image.
- New eraser tools that help you create special effects from many different shapes. You can use the Elliptical or Rectangle tools, or the new special eraser tool called the Paint Bucket.
- A new Adobe Animate tool that can create motion graphics.
- Improved performance and speed with the addition of new tools in the file browser.
- Many new filters, including a built-in special effects filter and an improved Eye Dropper tool for using the filters on images you've already processed.
- New features in the Camera Raw filter, including the ability to edit the colors in RAW files and to rotate a RAW file before you edit it.

Photoshop CS4 Pro is available as a free trial download from adobe.com. The new version of Photoshop CS4 was released in May 2009 and includes a number of new features, including:

- The ability to select an area on your canvas, edit it in its entirety, and then duplicate it.
- A new Magic Wand tool that allows you to select any area of an image with a shape of your choosing.
- A new Content-Aware Fill tool that automatically fills in small areas of a photo, which makes for easier resizing or adjustment of the image.
- An updated Brush tool with the ability to make semi-soft and fully soft edges. You can also change the orientation of the brush so you can paint with your brush stroked in any direction.
- The introduction of Smart Objects, which lets you add and modify selective portions of an image with new tools.
- Eye Dropper options that enable you to sample

The objective of this project is to define the mechanism of action of aripiprazole, an antipsychotic approved for treating acute exacerbations of schizophrenia and bipolar mania. Abnormalities in dopamine and glutamate neurotransmission are core abnormalities in these disorders. Aripiprazole potently and selectively binds to the D2 and 5-HT1A receptors, and does not demonstrate occupancy of D1, D3, and alpha adrenergic receptors. Preclinical animal data support the hypothesis that the effect of aripiprazole is attributable to its high level of dopamine D2- receptor occupancy in vivo, and subsequent decrease in glutamate release through D2 receptor suppression and 5HT1A stimulation. Aripiprazole acutely augments in vivo striatal dopamine levels in rats and monkeys, and improves social behavior in a rat social interaction model. The specific aims of this proposal are as follows: 1) To define the relative contribution of D2 and 5-HT1A receptor occupancy and downstream second messenger response in mediating the pharmacological actions of aripiprazole in animal models of schizophrenia and affective disorder. Using in vitro autoradiography, receptor occupancy studies will be conducted in six well-established animal models of schizophrenia and bipolar disorder, and the second messenger effect will be studied by measuring cAMP, phosphoERK1/2, and phospho CREB levels in brain regions known to be involved in psychiatric disorders. 2) To determine the effect of chronic aripiprazole treatment on cell signaling in mice and rats, and to quantify receptor occupancy and downstream second messenger levels in striatum and nucleus accumbens as a function of aripiprazole dose and chronic administration. 3) To complete our human clinical trial (by 12/31/2000) assessing the dose-response characteristics of aripiprazole in schizophrenia, and collect and bank blood and cerebellar specimens for future pharmacogenetic studies. The mechanistic data collected in this project will provide clinically useful information about aripiprazole mechanism of action that should aid in its therapeutic development. Personality and attitude toward psychotherapy in pernicious anemia. Medical students in a psychiatry clerkship (N = 3,098) were asked to complete three personality inventories and a 5-pt Likert scale measuring attitude toward psychotherapy. The response rate to this survey was 74.1%. A few selection effects are considered. Although no statistically significant effects were found, a reduction in the mean Likert score on the psychotherapy scale was found among those of Jewish ethnicity, those reporting a history of emetophobia, and those who were older. The data indicate that the psychotherapy scale may be useful in identifying attitude toward psychotherapy which is relatively independent of major demographic variables but which are associated with certain medical characteristics./* * reserved comment block * DO NOT REMOVE OR ALTER! *//* * Licensed to the Apache Software Foundation (ASF) under one or more * contributor license agreements.
