Photoshop CS3 is the latest version. It shares many of the previous versions' features, plus some new ones. Basic concepts A photo is made up of dozens, even hundreds, of layers. Each layer, in turn, is made up of numerous pixel, or dot, points that make up the image. Layers are arranged so that the final image can be edited — changed through layer masks, color adjustment layers, and effects, for instance. One of the best things about Photoshop is that unlike most photo-editing programs, the features are organized as a series of menus, buttons, panels, and windows — basically, anything you can see or touch — that you can activate simply by selecting them, pressing the keys that activate them, or clicking on them. The bottom line: Photographers, designers, and anyone else who works with images benefit from knowing the basic concepts of layers and how to use those layers to alter and enhance digital photographs. Exploring Photoshop This section, therefore, is aimed at helping you familiarize yourself with the Photoshop user interface and apply some of those Photoshop fundamentals to your images. I cover the user interface, tools, and various features that can be used to modify and improve digital images. I begin with an overview of the user interface, and then cover the layers that are used to edit images in Photoshop. I also discuss layers and the work they do. Digging into Photoshop's user interface The Photoshop user interface is based on a Windows-based program, and many of the tool windows and features are basically like the windows in other Windows programs. This section explores both. As with any Windows-based program, if you have a menu bar at the top of your image window, you can click it to open the menu of options or menu bars that appear in Photoshop, as shown in Figure 13-1. For example, the top menu has the following options: File: Create a New File. This option puts an image into Photoshop and creates a new image from it. Edit: Provides the tools to edit the images. Image: Opens the Image Bin, which enables you to quickly and easily open and save images in Photoshop. View: Lets you view the image or manipulate the image properties, such as size, resolution, and so on. Windows: You'll use this menu only if you have more than one monitor and want to set up multiple monitors with

Q: SQL - How to add details into the output generated by one query I am doing a query to select distinct product names and the products count from a table. select product\_name, count(\*) count from order\_details where order\_date > '01-Dec-2013' and order\_status = 'Placed' group by product\_name product\_name count ----- 500 2 101 1 But I need to add the details in the data. The output should be product\_name count count\_customer\_details ----- 500 2 cust\_1 101 1 cust\_2 How to get such a resultset? A: Use a subquery select product\_name, count, (select count(\*) from order\_details where order\_date > '01-Dec-2013' and order\_status = 'Placed' and product\_name = a.product\_name) as count\_customer\_details from order\_details a group by product\_name In general, you would not want to nest two queries like this. That would mean the query is only returning the data once. It's much better to have the second query be a subquery that is just returning something else. This is a rare situation, but it can be useful. The point is, that the result set of the outer query is not supposed to change. In this particular situation, that's not a problem. iggy Bestwood Registered User Member# 593766 Posts: 3 Joined: 7-February 18 Posted on 9-April-2005 at 10:02 AM (#8) Quote: Kiero wrote: i am sure there is a 10th floor somewhere

Isolation of Microvirga populi from infected apiaries. Microvirga populi was isolated from healthy and diseased adult bees taken from apiaries in Colombia and from five honey-containing bee hives with clinical signs of American foulbrood (*A. mellifera scutellata* x *mellifera scutellata*) near Atlanta, Georgia, U.S.A. *A. mellifera scutellata* x *secutor* (Buckley) from Maryland was also infected. Colony reinfection with *M. populi* was unsuccessful. *M. populi* was cultured on five different media, grown on agar slants, and purified. It is auxotrophic for hemin, menadione, and thiamine and electron microscopic examination revealed that it is in the spirillum or bacterium in the spirillum group. This is the first reported instance of isolation of *M. populi* from honeybee mite-infested bees. Q: How to break out of "for" statement I have a loop: for x in range(0,len(item\_dict)): for y in range(0,len(template)): print template[y] print item\_dict[x] However I wanted to break out of the inner loop before it reaches the length of template. When I tried, it looks like this: for x in range(0,len(item\_dict)): for y in range(0,len(template)): if x!= len(item\_dict): print template[y] print item\_dict[x] but it's still not working. How can I do this? A: There are at least two problems here. I'm sure it will be easier to fix the ones you find, but here are some possibilities. (1) You can't do this: for x in range(0,len(item\_dict)): for y in range(0,len(
