colleagues found that graphene can conduct heat and electrical currents very well. Credit: Erik S.

Novoselov/University of Manchester
Graphene, a material that has been touted as a wonder material with a host of potential uses, is not actually an electrical conductor, according to a paper published this week in Nature by researchers from the University of Manchester and the University of California, San Diego. The researchers, led by the University of Manchester's Dr. Viktor Novoselov, have demonstrated how graphene can conduct heat and electrical currents, but they say that graphene is not actually conducting electricity.

"Graphene is widely touted as a material with a host of potential uses,

and I am sure many engineers and scientists have just come to accept the description of graphene as a conductor," says Dr. Novoselov. "But we have shown that graphene is not actually conducting electricity because we were able to put electrical current into it and detect it, but not through it." He says the study shows that graphene is very good at conducting heat, but it is not as good at conducting electrical currents. "If graphene were to be used as a conductor for electricity, for instance, as a wire, then it would have to be much, much thinner than the width of a single carbon atom to get significant electrical conductivity," says Dr. Novoselov. "But if you make a thin film of graphene, then the current will not pass through it. What we have
