You can use all the tools in the fold and still take advantage of the AI features to help you along the way. No one tool is more important than the other, and unlike Lightroom, Photoshop doesn't force you to use one. In addition, one could argue that Photoshop is the most versatile tool, and while that may be up for debate, it's true that Photoshop handles more tasks than Lightroom, while Lightroom excels at managing and cataloging your images. I find both programs to be essential tools in my workflow and I hope to see more integration features in future revisions. One of the biggest changes so far is nothing new, but a mistake anyone would make with Photoshop CC - the "reasoning engine" has been upgraded to the latest version. For one, the thinking has been moved from the software to camera RAW files. Not only does this prevent the need for any manual interventions, it also means the software can learn from your actions to become even smarter. The workflow for editing images has been well thought out. You open an image, create a new adjustment, make the change and then save your image. From there, you can print or do what you like. You won't lose your artboard if you created an adjustment on the foreground, change it and now need to print it. You can always recover lost artboards. The improvements to Photoshop are not restricted to the software's new features. For the user, one noticeable change is the workflow. Currently, the workflow is a bit more complicated and the user interface is more difficult to use. However, the workflow in Photoshop is only the beginning: Future versions promise even greater features and more streamlined workspaces. It's a great idea by Adobe to better equip photographers for the world of AI editing. It still could be better, though. The interface is, for example, a bit more clumsy and simplistic than what I would have preferred.
