Since Photoshop is based on color, a primary around it's core, the first step is to convert a color into it's digital representation. Each of these color components can be reduced to a single digit number to put them into closest relationship. As a start, the red, green, and blue components are based on the spectral response of the human eye, and each one is assigned a fixed numeric value. Although the human eye is not spectrally sensitive, we still see the same colors when the conditions are ideal.

Through spectrography, the wavelengths of light that reach the eye are approximated. We then see a mix of the wavelengths that produce the light, called spectral power distribution. The exact components that mix to form a specific color for any object depend on the objects color, but the result is a range of numbers that represent a specific color. Thus, an RGB color space is composed of the spectral domain in 3 dimensions of red, green, and blue, and the following values are evident.

The first color space that we will discuss is the RGB color space. In this model, the color is represented by three values. These values are comprised of the three primary colors that we see in the form of red, green, or blue. The values, consequently, are referred to as R, G, and B. The entire color space is 3 dimensional, thus the XYZ color space is the traditional model. It's not to say that we only see red, blue, and green when we look at something, but that it's the range of the human eye's spectral range that is represented in red, green, and blue. e3d0a04c9c

Now, with simple changes in vectors, you can update logos or advertisements, even temporarily, simply by dragging and dropping them on a brand's template. For example, you can drag a logo from a website to a Photoshop Illustrator document and update the colors. With the combined sprints for both Photoshop and Illustrator this year, Adobe's customers will rewrite the rules of global graphics. **Adobe Kuler** Collaborates on content creation across devices and formats, allowing users to grow a collection of color-saturated spin-off artwork at the touch of a button. Social groups share color palettes among peers, and brands can also become members helping create a collection. Plus, with new updates to the service, you can now create an unlimited number of groups. **Adobe Sensei** For developers and data scientists by design, Adobe Sensei is a neural network-based AI engine that powers new and exciting improvements in the Photoshop editors. Sensei enables deep learning and machine learning capabilities in the desktop app and works like a natural language interface to query computer resources.
